BY THE REV. S. VINCE, . book.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 76 pages. Dimensions: 9.7in. x 7.4in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1799 Excerpt: . . . As telescopes were in use at that time, it is probable that each might make the discovery. Admitting these spots to adhere to the sun's body, the reasons for which we shall afterwards give, we proceed to show, how the time of its rotation may be found. 238. M. Cassini determined the time of rotation, from observing the time in which a spot returns to the same situation upon the disc, or to the circle of latitude passing through the earth. Let t be that interval of time, and let m be equal to the true motion of the earth in that time, and n equal to its mean motion; then $360^\circ : 360^\circ :: t : T$ the time of return if the motion had been uniform, and this, from a great number of observations he determines to be 27. 12. 40; now the mean motion of the earth in that time is $270^\circ 7' 8''$; hence, $360^\circ : 270^\circ 7' 8'' :: 27. 12. 40 : T$ the time of rotation Elem. de Astron. pag. 104 239. When the earth is in the nodes of the sun's equator, it being then in its plane, the spots appear to describe straight lines; this happens about the beginning of June and December. As the earth recedes from the nodes, the path of a spot grows more and more elliptical, till the earth gets 90° from the nodes, at which time it happens about the...
